

Ocean-condition & visitor-intent data we can share for public safety

What OceanSafe collects, what we can hand to your teams, and how we keep it anonymous — offered at no cost as a public-safety contribution.

OceanSafe is a beach-conditions and safety guide used by visitors across Kaua'i, Maui, and O'ahu. People open it to decide where to go and to check whether a beach is safe before they get in the water. That behavior tells us where visitor attention is heading, and where it lines up with hazardous conditions. We think that picture belongs with the people who keep beaches safe, so we would like to share it. Everything below is **anonymous and aggregated** — we hold no names, emails, phone numbers, room numbers, IP addresses, or device IDs. What we can give you are counts and patterns, never a person.

— What we can share

Where demand meets danger

MOST USEFUL

How many people are checking or planning a beach while it is under a posted hazard — high surf, strong current, a brown-water advisory, or a box-jellyfish window.

Why it helps: it shows where visitor interest and dangerous water are colliding, before anyone gets in.

Beach demand index

Which beaches visitors are viewing and planning for, ranked by island and updated continuously.

Why it helps: a read on where crowds are forming, useful for prioritizing patrols, signage, and outreach.

Timing patterns

When visitors plan and check conditions — hour of day, day of week, and the surge on arrival days.

Why it helps: aligns messaging and staffing windows with when people actually choose a beach.

Safety-message engagement

How often hazard warnings and guidance — rip-current spotting, check-before-you-go cards — are opened and read.

Why it helps: shows which safety messages are landing and which get skipped, so wording can improve.

Language mix

The app languages visitors choose (English, Japanese, and others as we add them). A language-preference signal, not a claim about nationality.

Why it helps: points to where multilingual signage and outreach would reach the most people.

Coverage gaps

Beaches and questions visitors search for that we do not yet have good safety data on.

Why it helps: a running list of where the public is looking for guidance and not finding it.

— How we keep it anonymous

- Anonymous from the first tap. No names, emails, phone numbers, room numbers, IP addresses, or device IDs are collected.
- Individual activity is rolled up into daily counts. Raw events expire on a rolling 90-day window.
- What we share is island- and beach-level totals and rates. Nothing traceable to a person ever leaves our system.
- Small groups are suppressed, so a count is never small enough to point at one visitor.

— What this data is not

We would rather be plain about the limits than oversell the signal.

- It reflects **intent**, not presence. A check means someone is considering a beach, not that they are on the sand or in the water.
- It samples app users, not every beachgoer. Treat it as a leading indicator, not a headcount.
- It is not lifeguard data or a rescue record, and it is no substitute for what your teams observe on the ground.
- Kaua'i has the most history today. Maui and O'ahu are newer, so their data is thinner for now.

— How you would receive it

- A live web dashboard you can open anytime.
- A monthly one-page summary by email or PDF.
- Custom cuts on request, such as one shore across a summer.
- No cost to Ocean Safety. We offer this as a public-safety contribution.

— We are open to any suggestion that makes the app safer

We built OceanSafe to help visitors make safer choices in the water, and the people who do this work every day see things we do not. Tell us what would help: data you wish you had, a warning you would want surfaced sooner, beaches that need more attention, wording that should change, or a hazard the app is not showing well. If it keeps people safer, we want to build it — and we would welcome a short call or a walk-through with your team.
