

OceanSafe

WORKING DEMO · SAMPLE DATA

FOR COUNTY OF KAUA'I OCEAN SAFETY

Your flags, live on every visitor's phone.

When a lifeguard changes a flag or posts a hazard, it shows up where people already check the water, before they get in.

Three things first

The safety layer never carries ads.

You won't see a promotion on a flag or a hazard. OceanSafe earns its money on other parts of the app. The part that carries **your warnings stays clean**.

You decide how you're shown.

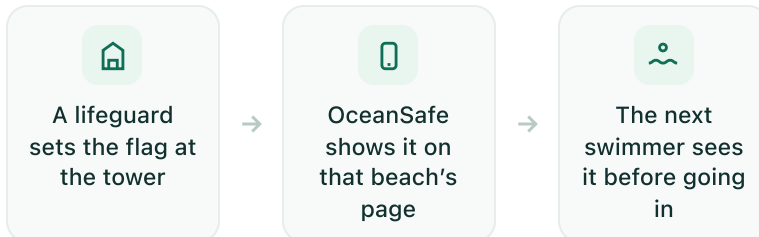

Your words, credited to your bureau, with a time on every card. A staleness rule pulls a card down on its own, so an old **"all clear"** can't read as **current**.

You can switch it off yourself.

There's one control, and it's on your side. Turn the feed off and it's off that minute. You don't have to call anyone or sign anything.

How a warning travels

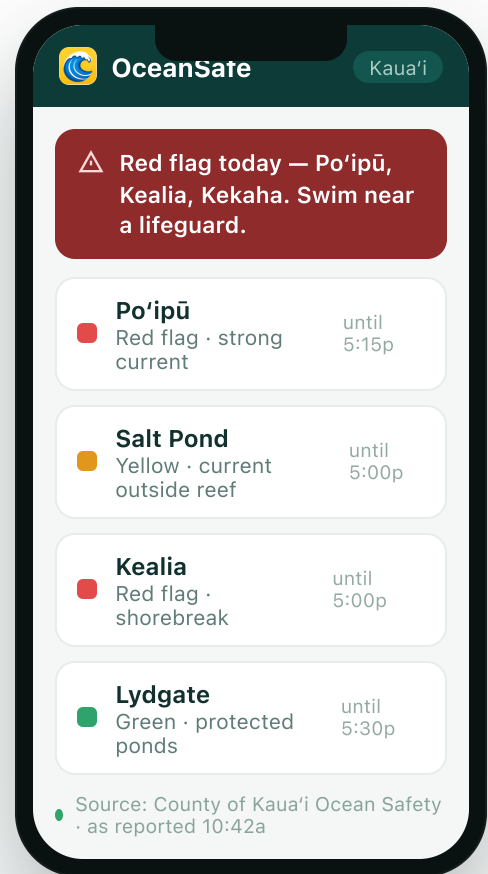

And what you get back

You see how many people saw each red-flag warning, so you know the call reached the water. The app also adds a brown-water and rain signal you don't track today.

What a lifeguard can post

- Flag status, per beach
- Shark & jellyfish sightings
- High surf & currents
- Staffing hours
- Closures
- A PDF advisory
- A QR code on each tower sign

Try the working demo

Point your phone camera at the code to open the live demo.

oceansafe-kauai-demo.netlify.app

This is a working demo built with **sample data**, not a live County system. The data would belong to the County of Kaua'i Ocean Safety Bureau (Kaua'i Fire Department). It's modeled on the digital reporting platform Honolulu Ocean Safety started using in 2026.
