ROI & Conversion

What a shop inside the beach guide earns, why it out-converts a website 3-to-1, and the demand data that comes with it — every number cited.

✓ 3x in-app conversion

✓ Published benchmarks, cited

✓ Your own co-branded guide

Benchmarks throughout; your dashboard replaces them with measured numbers in month one.

WHY IN-APP SELLS

Your buyers decide after they land

A third of experience bookings happen **after travelers arrive** — and once they're here, the planning moves to the phone. An app converts that moment about **three times better than a website**. The arithmetic, with the industry numbers behind it:

1 in 3

experience bookings are made after travelers arrive

Viator x Tripadvisor

61%

research an activity within 7 days of doing it

Viator x Tripadvisor

54%

of activity searches go mobile once travelers are in-destination

Google travel data, 2024

3x

apps out-convert the mobile web

Criteo app-commerce study

THE EQUATION

Guests

reached with your QR, receipt, or booking link

×

Opens

the share who open the guide during their stay

×

6%

of storefront viewers buy, at in-app rates

=

Orders

every month, on top of your walk-in trade

Where the 6% comes from: a typical travel website converts about 2% of its shoppers — and in-app storefronts convert about 3x that. So **2% x 3 = 6 buyers per 100 guests who see your shop**, against 2 on a website.

Worked example: 1,000 guests reached x 30% who open the guide x 6% ≈ **18 orders a month** — from guests who were never going to find your website.

Benchmarks, not a promise. Published industry research — Viator x Tripadvisor traveler studies, Google travel data (2024), Criteo's app-commerce study, Phocuswright x Arival booking-window data. Your storefront's real open and buy rates show up in your dashboard, so the math replaces itself with your numbers.

ATTENTION — THE TOP OF THE EQUATION

They open it for the ocean. Your shop is standing there.

Nobody downloads a shopping app on vacation — but everyone checks the ocean. Surf, rain, and beach-safety verdicts give guests a reason to open the guide **every day of their stay**, and every open walks them past your storefront. That's the **Opens** term in the equation — utility fills it for you.

Repeat opens, not one visit

A website gets one look before the trip. A conditions guide gets checked morning after morning — each check is another storefront impression at zero ad cost.

LIFTS: OPENS

No download, no account

The QR opens a web app instantly. No app store, no sign-up wall — the two doors where mobile shoppers give up and leave.

LIFTS: OPENS

Rough days work for you

When the surf's up or the rain's in, guests are on their phones looking for a plan B. The guide is where they look — and plan B is your gear, your shop, your tours.

LIFTS: OPENS & BUY RATE

Live swell & conditions — the reason they open it

Rain radar — the rainy-day plan starts here

The firewall stands. The attention comes from honest safety information — so promotions show in the shop and Town, never on a beach's safety verdict. That honesty is why guests keep opening it, and why the attention is worth having.

TIMING — THE MULTIPLIER ON THE BUY RATE

The right offer at the moment it's needed

A website shows every visitor the same shelf. The guide knows what today looks like — because that's what guests ask it. **High-UV morning: sunscreen. Flat-calm bay: snorkel sets. Red-flag surf: tours and town.** Matching the offer to the conditions is what pushes the in-app buy rate past a website's, and it's why 40% of tour bookings land within 3 days of the activity (Phocuswright x Arival) — the decision is made in-destination, in context.

Guide opens & promotion tap-through by hour

PAID

SAMPLE

Send when they're looking: opens spike with the morning beach check and again before dinner. A promotion timed to those windows is seen while plans are still being made — not after.

What this does to the math: condition-matched offers and timed promotions raise the **6% buy rate** term — the same storefront, shown when wanting it is at its peak. Your dashboard shows the tap-through by hour, so the timing tunes itself.

FRICITION — WHERE CARTS GO TO DIE

Most carts are abandoned. Shorten the walk.

The web loses most of its buyers **after** they decide to buy. The killers are known: surprise costs at checkout, forced account creation, long forms, and downloads. The storefront removes each one — that's the rest of the gap between 2% and 6%.

70%

of online carts are abandoned before purchase

THE WALK, SHORTENED

SCAN

QR → storefront

No app store, no download — the shop is just open.

Kills: download drop-off

TAP

No account, no forms

Guest checkout by default — nothing to register, nothing to remember.

Kills: sign-up abandonment

PAY

Your Square, their card

A checkout flow phones already trust — and the money lands in your account.

Kills: payment distrust

PICK UP

At your counter

No shipping, no fees at the end — the #1 cart-killer never appears.

Kills: surprise costs

Pre-arrival ordering removes the last friction: time. A link in the booking confirmation opens the guide pre-loaded with their dates — guests order gear and tours before they land, and it's waiting at pickup. The decision is made calmly at home, not squeezed into day one.

Source: Baymard Institute's running meta-analysis of cart-abandonment studies — the industry's standard reference on checkout loss. Abandonment figures are web-wide averages; your storefront's own completion rate shows in your dashboard.

THE REST OF WHAT YOU GET

Your register knows what sold. The guide knows what they wanted.

The storefront pays for itself — you’ve just seen that math. What the fee actually buys is everything around it: attention you’d otherwise rent, losses you’d otherwise eat, and demand you’d otherwise guess at. Each one lands as money replaced, loss prevented, or a better decision:

Placement replaces ad spend

MONEY REPLACED

A click on “snorkel rental Kaua’i” costs \$1–3 on Google. Every guest who sees your storefront in the guide is that same click — free, and standing on the island already.

500 storefront views a month ≈ **~\$750 of paid clicks** at typical travel-keyword prices — before a single sale.

Return texts prevent losses

LOSS PREVENTED

Every rental carries a return-due time, and guests opt in to a reminder text. Fewer boards that never come back, fewer afternoons spent calling around.

One saved \$300 board a month is **\$3,600 a year** — recovered by a text.

Demand data improves decisions

THE ASSET

Square logs the transaction. The guide sees the **intent before it** — what guests browse, when they plan, and what the ocean was doing at the time. High-UV days spike sunscreen interest; red-flag surf spikes tours. That’s stocking, staffing, and ordering on evidence, not hunch.

Retailers pay foot-traffic services **hundreds a month** for panel guesses. This is measured in your own storefront, tied to conditions nobody else tracks.

Borrowed trust converts

THE UN-COPYABLE PART

Your shop sits inside the tool guests use to stay safe — next to live conditions and lifeguard info, not between ads. That context is why in-app conversion holds at 3x a website’s.

Promotions show in the shop and Town — **never on a beach’s safety verdict**. The honesty is the moat.

“The storefront pays for the fee. The fee buys you what a thousand guests wanted this month — the cheapest market research on the island.”

Demand data is aggregate counts only — no names, no individual tracking. A tap is interest, never claimed as a booking.

YOUR GUIDE — NOT A PAGE ON SOMEONE ELSE'S

A standalone guide with your name on it — and how it reaches guests early

Your OceanSafe guide is **standalone and co-branded to you** — your name on the header, your shop and tours inside, not a listing buried on a hotel's page. One link opens it, and every place you put that link becomes reach — two of them before the plane lands:

CHANNEL 1 · PRE-ARRIVAL**The confirmations you already send**

Take tour reservations or rental holds? Whatever email or text you send today can carry your guide link — “**check the week's ocean & order ahead for pickup**” — from any booking tool, no integration. If your tool fills dates into the link, the guide opens date-aware.

PASTE ONE LINK**CHANNEL 2 · PRE-ARRIVAL****Website, Google profile, Instagram**

Trip-planners hit your Google listing and Instagram weeks before they fly. One button — “**Plan your beach days**” — turns those lookers into users of **your** guide, with your shop front and center.

PASTE ONE LINK**CHANNEL 3 · DAY ONE ONWARD****The counter QR keeps them**

Even a walk-in becomes a repeat viewer: the QR at your counter and on receipts hands them **your guide for the rest of the stay** — every surf check after that walks past your shelf, not a competitor's.

EVERY RECEIPT, EVERY BAG TAG

`oceansafety.app/?ref=your-shop` — one link, every channel; orders staged for pickup the day they land

Why it's worth reaching them early: travelers who book activities ahead of the trip are the bigger-basket customers — Google's research found they spend 47% more on lodging and 81% more on transportation than those who wait. A pre-arrival order is day-one revenue, decided calmly at home.

Honest mechanics. Your guide is its own co-branded build — it doesn't depend on any hotel's page, and no hotel's guide carries your competitors past your customers either. Date-aware nudges need a link that carries stay dates — possible wherever your booking tool supports merge fields; plain links open the live guide and storefront. Pre-trip spend figures: Think with Google, travel research.

THE STACK

Utility fills the funnel. Timing and friction finish it.

Each piece moves one term of the same equation. The safety guide earns the **opens**; conditions and timed promotions raise the **buy rate**; a frictionless checkout keeps it. None of it depends on your guests ever finding a website — and the guide it all lives in is standalone, co-branded, and yours.

And every term is measurable.

Opens, storefront views, taps, and orders roll up per property in your dashboard — so the benchmarks on page 1 get replaced by your own numbers within the first month. A tap is counted as interest, never claimed as a booking.
