

— THE POST-ARRIVAL WINDOW

Everyone owns the booking. Nobody owns the trip.

OceanSafe is a free ocean-safety app that Hawai'i visitors check each morning of their stay. Nine million people land here every year and spend twenty billion dollars, yet almost nothing is known about what they do between check-in and the flight home. This app is how we come to know it.

WHAT IT IS

A safety habit, checked before anyone gets in the water.

Each beach gets live surf, wind, rain and UV readings, plus a plain-language read on the day. No login, no download, free. Visitors come back to it morning after morning for the length of the trip, and that repeat visit is the whole point.

01 Live conditions, plainly put

Not a raw buoy feed. A cautious read a first-time visitor can act on.

02 On the home screen

Installs like an app, works at the beach, loads in a second.

03 Checked daily

An 8.7-night average stay means eight or nine mornings of use per visitor.

THE PROBLEM UNDERNEATH IT

Hawai'i's ocean is the deadliest part of an American vacation.

Drowning is the leading cause of death for visitors here, and snorkeling — the thing people fly in to do — drives more of it than anything else.

~45

visitor ocean drownings per year,
2019–2023

No. 1

cause of visitor death in the state

53%

of drowning victims are visitors — the
only injury type where that's true

42%

of visitor drownings happen while
snorkeling

Over 200 visitors have died snorkeling in the past decade. A nervous first-timer has a real reason to check conditions every morning, which is why this app earns a place on the home screen that a coupon app never could.

Source: Hawai'i Department of Health, EMS & Injury Prevention System Branch — mortality among non-residents, 2019–2023.

— WHERE THE MONEY IS

Most of the \$20.7 billion gets spent after the plane lands.

A booking is one decision. The trip itself is nine days of small ones: which beach, which tour, where to eat, what to bring home. That is where the discretionary money moves, and it is the part of the trip no one measures.

THE GAP

The trip has four chapters. Three are measured to death. The most valuable one is dark.

DREAM & RESEARCH

Before the trip

Google, TripAdvisor, Instagram.
Thoroughly instrumented.

BOOK

Check-in

The OTAs and the hotel's own
systems know exactly who
booked.

IN DESTINATION — OCEANSAFE

The 8.7 nights

What visitors actually plan and do, day by day, against
live ocean conditions. Nobody else collects this. The
OTAs stop at check-in; hotels know who's in the room,
not where they went; Google sees the search and the
review, never the middle.

REVIEW

After

Google and Yelp again — useful,
but the money is already spent.

Booking data is a commodity anyone can buy. In-destination behavior isn't for sale at any price, because until now nothing sat in the visitor's pocket all trip long with a reason to be opened daily.

WHAT THE DATA LOOKS LIKE

A live read on visitor intent, tied to the conditions that drive it.

- **Which beaches** guests plan for, and at what hour they decide.
- **Which activities** they weigh — snorkel, surf, calm water, family.
- **How far** they roam from a property, day by day.
- **Which offers** actually get tapped, and which get ignored.
- **Language and device mix** — who the market really is, live.

Groups, never people. Counts and percentages only. No individual, no device, no room number is ever stored or reported. The same aggregation model STR used, and it sold for \$450 million.

From the live operator console. Figures are labeled sample data — the pipes are real, the fleet isn't seeded yet. Guests plan at breakfast, at the pool at 2pm, and the night before.

WHY THIS POSITION HOLDS

A daily safety habit is a data surface money can't buy.

01 The habit is earned, not bought

Safety gives people a reason to return every morning. There is no ad budget that puts a brand into someone's beach-day decision at 7am; you have to be the thing they check.

02 Intent is captured at the moment of choice

Every signal arrives stamped with the surf, wind and weather that shaped it. A clickstream from the mainland carries none of that context.

03 Each property makes the picture sharper

Every hotel and island added thickens the panel exactly where the rest of the industry is blind. The asset compounds; a copycat starts from zero mornings.

HOW IT PAYS FOR ITSELF

The data never has to be sold. It makes the app worth paying for.

Revenue comes from the businesses inside the guest's trip, not from selling the dataset out the back.

WHO PAYS	WHAT THEY GET	SHAPE OF THE REVENUE
Hotels & resorts	The guide free forever; a paid tier puts their brand and offers in every guest's pocket, with a private view of guest behavior.	Flat monthly, per property
Shops & concierge	Storefronts and bookings inside the app — the guide gets paid when it moves real spend.	Share of transactions
Town businesses	A placement in the local guide, priced for a coffee shop rather than a chain.	Small monthly ad

The visitor side stays free, and safety is never gated. That rule protects the daily habit, and the habit is the asset.

WHAT THE MODEL NETS

Modest adoption already pays for the build.

These are the prices live in the app today. The three columns are how many businesses subscribe across the three live islands. Hotels stay free, so this recurring line sits on top of the free base, not in place of it.

SUBSCRIPTION LINE	MONTHLY	CONSERVATIVE ≈2% SUBSCRIBE	BASE ≈5% SUBSCRIBE	REACH ≈10% SUBSCRIBE
Hotels & resorts optional branded tier	\$649	\$1.9K	\$5.2K	\$9.7K
Concierge & activity desks	\$829	\$4.1K	\$10.8K	\$20.7K
Retail & beach shops	\$500	\$3.0K	\$7.5K	\$15.0K
Town businesses local ad	\$30	\$0.5K	\$1.2K	\$2.4K
Paying accounts		30	76	150
Monthly recurring		\$9.5K	\$24.7K	\$47.8K
Annual run-rate		\$114K	\$296K	\$574K

Even the Reach case runs about **\$574K a year**. That is real money, and enough to fund a lean build with no investors to repay, yet a fraction of the **\$7M–\$50M** an acquirer would pay for the dataset itself. The subscription keeps the lights on. The data is what gets bought.

How to read this. Prices are OceanSafe's current published rates. The eligible base across Kaua'i, O'ahu and Maui is estimated at roughly 150 hotels, 250 concierge and activity desks, 300 retail shops and 800 town businesses; each column applies a 2% / 5% / 10% subscribe rate to that base. Counts are planning assumptions for this conversation, not a forecast. Transaction share on the free tiers, plus timeshare and vacation-rental per-unit licenses, are additional and excluded here.

WHAT'S LIVE TODAY

Running in-market now, built by one person.

- **Three islands live** — Kaua'i, O'ahu and Maui, on real-time conditions.
- **Operator console built** — the analytics you saw two pages back, demoable today.
- **Privacy policy shipped** — aggregate-only, in public, in writing.
- **Co-branding proven** — a hotel can make the guide its own channel in a day.

THE ENDGAME

This isn't built to run a subscription forever. It's built to be *bought*.

Become the default in-destination layer for Hawai'i, prove the data with brand-name hotels, and be cheaper for a travel company to acquire than to copy. Expedia, Booking and TripAdvisor all monetize the before and after of this exact trip; the middle is what they're missing.

1 — Traffic

Free for every hotel. Guest usage plus reference logos.

2 — Asset

Usage builds the dataset; shops and ads fund the build.

3 — Scale

OTA partnerships; a name the industry recognizes.

4 — Exit

A strategic buyer acquires the position. That's the win.

— IS THE EXIT REAL?

Behavioral-data companies get bought. Here's the record — and the honest math at our size.

DEAL	THE DATA	OUTCOME	YEAR
STR → CoStar	Aggregated, anonymized hotel performance — the same privacy model we run.	\$450M	2019
Segment → Twilio	Customer behavior data, bought for what the data made possible.	\$3.2B	2020
ADARA → RateGain	Permissioned traveler-intent data, rolled up by a travel-tech buyer.	Acquired	2023
Placer.ai	Anonymized foot-traffic from apps — the closest analog to ours.	\$1.5B _{valuation}	2024

Scaled honestly to one state. Those companies operate nationally or globally; we cover Hawai'i. The state is about **1.6% of U.S. travel spend** (\$20.7B of \$1.3T), so the right way to read the comps is at that scale — roughly **\$7M–\$50M**, not hundreds of millions. For a founder-owned build with no investors to repay, that's the entire point. For any buyer on this page, it's a rounding error.
